Schedule SB, Part V – Statement of Actuarial Assumptions / Methods

Actuarial Cost Methods:

Traditional Unit Credit

The actuarial cost method used in the valuation was the traditional unit credit cost method.

The normal cost is the sum of all the individual normal costs for each participant. For active participants, the individual normal cost is the present value of the benefit earned during the year being valued. The normal cost is zero for active participants whose credited service equals or exceeds the plan maximum, and for non-active participants.

The actuarial accrued liability is the sum of the individual accrued liabilities for all participants. The individual accrued liability for an active participant is the present value of the accrued benefit as of the valuation date. For non-active participants, the individual accrued liability is the present value at the current age of future benefits. The unfunded liability is the actuarial accrued liability less the valuation assets.

The total annual cost of the plan is the normal cost plus an amount to amortize the shortfall amount.

Projected Unit Credit

The actuarial cost method used in the development of the maximum contribution and the at-risk liabilities, if applicable, was projected unit credit cost method.

Under this method, the normal cost is the sum of the individual normal costs for all participants. For an active participant, the individual normal cost is the present value at the current age of the projected benefit at the assumed retirement age, based on the actuarial assumptions, divided by the participant's expected years of credited service at that age. For a non-active participant, the normal cost is zero.

The actuarial accrued liability is the sum of the individual accrued liabilities for all plan participants. For an active participant, the individual accrued liability is the product of the normal cost and the total years of credited service at the current age. For non-active participants, the individual accrued liability is the present value at the current age of future benefits. The unfunded actuarial accrued liability equals the actuarial accrued liability less the valuation assets.

Asset Valuation Method:

The actuarial value of the assets is determined as the market value of the plan's assets at the valuation date and includes discounted contributions receivable.

Participants included in valuation:

All employees who are eligible to participate as of the valuation date, plus retirees, beneficiaries and terminated participants entitled to current or future benefits.

Schedule SB, Line 25 – Method Change

Mandatory Changes

The mortality assumption is based upon the static RP-2000 Mortality Table for males and females and is projected with mortality improvements by scale AA seven years beyond the valuation date for 2011 for annuitants and fifteen years beyond the valuation date for non-annuitants. Plans with less than 500 participants can use an optional combined table which is the table incorporated in this report.

The funded target percentage increased to 100% from 96%.

Sealed Air Corporation continues to use the segment rates published for January preceding the plan year. The January, 2011 segment rates are 2.94% for the first five years, 5.82% for the next fifteen years, and 6.46% thereafter.
