Summary of Actuarial Assumptions and Methods

A. ACTUARIAL METHODS

Actuarial Cost Method

The true cost of a pension plan will ultimately be determined by the excess of benefits actually paid and the expenses incurred in its administration over investment income earned on monies set aside for its funding. Thus, the ultimate cost of a plan cannot be known until the last payment has been made to its last participant. The actuarial cost method is the technique adopted by the actuary for establishing the amount and incidence of annual actuarial costs. The actuarial cost method determines the portion of the ultimate cost of a pension plan which should be allocated to each plan year (known as the normal cost). The cost method is thus a budgeting tool which helps to ensure that the pension plan will be adequately and systematically funded.

The actuarial cost method used in the valuation of this Plan is known as the unit credit cost method. Under this cost method the accrued retirement benefit is computed for each participant at the valuation date. Also, an accrued retirement benefit is projected for each participant at the end of the plan year assuming one more year of service and additional pay, if applicable. The Target Normal Cost for each participant is computed as the present value of the difference between the participant's projected accrued benefit at the end of the plan year and the accrued benefit on the valuation date. The Target Normal Cost for the plan is the total of the individually computed Target Normal Costs for all participants including the costs for any death or disability benefits under the plan.

The Target Liability at any point in time for an active participant is the present value of the accrued retirement benefit on the valuation date. For persons receiving benefits or entitled to a deferred vested retirement income, the Target Liability is equal to the present value of their future benefit payments. The Target Liability for the plan is the total of the individually computed Target Liability amounts for all participants. The shortfall amount for the plan is the excess of the Target Liability over the assets which have been accumulated for the plan. This shortfall amount will be liquidated over a period of seven years with fixed payments.

The funding cost of the plan is derived by making certain specific assumptions as to rates of interest, mortality, turnover, etc. which are assumed to hold for many years into the future. Since actual experience may differ somewhat from the assumptions, the costs determined by the valuation must be regarded as estimates of the true costs of the plan.

Valuation Assets: The Actuarial Value of Assets is equal to the average of the market value of assets on the valuation date and the two prior valuation dates. The values as of the prior two valuation dates are adjusted with contributions, benefit payments, administrative expenses, and expected earnings from each valuation date to the current valuation date. Expected earnings are calculated using an expected rate of return limited to the third segment rate for each period.
