The actuarial cost method is a particular technique used by the actuary for establishing the amount and incidence of annual actuarial costs. The actuarial cost method determines the portion of the ultimate cost of a pension plan that should be allocated to each year (known as the normal cost). The cost method is thus a budgeting tool that helps to ensure that the pension plan will be adequately and systematically funded.

The annual cost for a pension plan is determined using the unit credit cost method. The ultimate cost for a pension plan will be determined not by the cost method but by the benefits and expenses which become payable and the earnings which are obtained on the investments of the Plan. In addition, the choice of actuarial assumptions will affect the current level of contributions and pattern of future contributions.

Under the unit credit cost method, the target normal cost for each participant is equal to the present value of the projected benefit (salary increases may be included) one year from the valuation date minus the present value of accrued benefits as of the valuation date. The target normal cost for the Plan is the total of the individually computed target normal costs for all participants including the costs for any death or disability benefits under the Plan.

The target liability at any point in time for an active participant is the present value of the participant's accrued benefit. For persons receiving benefits or entitled to a deferred vested retirement income, the target liability is equal to the present value of their future benefit payments. The total target liability for the Plan is the total of the individually computed target liability amounts for all participants.

Certain assumptions are made in the calculation of the target liability, such as: interest rates, mortality, turnover, etc. which are assumed to hold for many years into the future. Since actual experience may differ somewhat from the assumptions, the costs determined by the valuation must be regarded as estimates of the true costs of the Plan.

The actuarial value of assets equals the fair market value of assets.

Interest rates

For purposes of determining the Adjusted Funding Target Attainment Percentage (AFTAP) and minimum required contribution, the valuation interest rates used are the HATFA rates issued by the Department of the Treasury:

<u>Segment one</u>	<u>Segment two</u>	<u>Segment three</u>
3.92%	5.52%	6.29%

For maximum deductible contribution purposes, the valuation interest rates are the three segmented rates as of January 1, 2017 with no lookback period:

<u>Segment one</u>	<u>Segment two</u>	<u>Segment three</u>
1.81%	3.68%	4.53%

Accrual of interest credits

For each plan year, and continuing until the last month before payment of a participant's benefit, the hypothetical account shall be credited with a hypothetical interest amount. The interest is credited by multiplying the balance of the participant's hypothetical account as of the beginning of the plan year by the applicable interest rate.

Limitation year

The limitation year is the 12-month period beginning January 1 and ending December 31.

Normal retirement age

A participant's normal retirement age is age 65.

One year break-in-service

A one-year break-in-service occurs in any plan year during which the employee completes 500 or fewer hours of service.

Plan year
