ACTUARIAL COST METHODS AND ASSUMPTIONS

Service Steel Division Van Pelt Corporation Employees' Pension Plan
EIN/PN: 38-1404408/006
Schedule SB, Part V – Actuarial Assumption Methods

Traditional Unit Credit Cost Method – The actuarial cost method used to calculate the minimum required contribution is the traditional unit credit cost method. The normal cost is the sum of all the individual normal costs for each participant. The individual normal cost is the present value of the benefit expected to be earned during the year being valued. For non-active participants, the normal cost is zero. The actuarial accrued liability is the sum of the individual accrued liabilities for all participants. The individual accrued liability is the present value of the accrued benefit as of the valuation date. The unfunded liability is equal to the actuarial accrued liability less the valuation assets, and is referred to as the “shortfall”.

Projected Unit Credit Cost Method – The projected unit credit cost method is used for computing pension liabilities used in FASB ASC 715 pension accounting and in the calculation of the maximum deductible contribution. Under this method, the normal cost is the sum of the individual normal costs for all participants. The individual normal cost is the present value of the benefit expected to be earned during the year being valued, assuming the benefit as of the beginning of the year and as of the end of the year are calculated with final average salary. For a non-active participant, the normal cost is zero. The actuarial accrued liability is the sum of the individual accrued liabilities for all plan participants. The individual accrued liability is the present value of the accrued benefit based on service as of the valuation date, calculated using final average salary. For non-active participants, the individual accrued liability is the present value of their benefit. The unfunded liability is equal to the actuarial accrued liability less the valuation assets.

Actuarial Valuation Asset Method Market value of assets.

Retirement Age – Age 65 with 5 years of participation
Rationale – retirement age in the plan document

Combined Mortality Tables (as prescribed by law) – RP-2014 adjusted to 2006 base mortality rates (combined annuitant and non-annuitant tables), projected from the valuation date with improvement scale MP-2021 (projection period is 8 years for males, 9 years for females, increased by 1 year for each year below age 80 and decreased by 1/3 year for each year above 80)

Percent Married - 100% of males and 100% of females were assumed to be married.
Rationale – Majority of participants are married

ACTUARIAL COST METHODS AND ASSUMPTIONS

Service Steel Division Van Pelt Corporation Employees' Pension Plan
EIN/PN: 38-1404408/006
Schedule SB, Part V – Actuarial Assumption Methods

Traditional Unit Credit Cost Method – The actuarial cost method used to calculate the minimum required contribution is the traditional unit credit cost method. The normal cost is the sum of all the individual normal costs for each participant. The individual normal cost is the present value of the benefit expected to be earned during the year being valued. For non-active participants, the normal cost is zero. The actuarial accrued liability is the sum of the individual accrued liabilities for all participants. The individual accrued liability is the present value of the accrued benefit as of the valuation date. The unfunded liability is equal to the actuarial accrued liability less the valuation assets, and is referred to as the “shortfall”.

Projected Unit Credit Cost Method – The projected unit credit cost method is used for computing pension liabilities used in FASB ASC 715 pension accounting and in the calculation of the maximum deductible contribution. Under this method, the normal cost is the sum of the individual normal costs for all participants. The individual normal cost is the present value of the benefit expected to be earned during the year being valued, assuming the benefit as of the beginning of the year and as of the end of the year are calculated with final average salary. For a non-active participant, the normal cost is zero. The actuarial accrued liability is the sum of the individual accrued liabilities for all plan participants. The individual accrued liability is the present value of the accrued benefit based on service as of the valuation date, calculated using final average salary. For non-active participants, the individual accrued liability is the present value of their benefit. The unfunded liability is equal to the actuarial accrued liability less the valuation assets.

Actuarial Valuation Asset Method Market value of assets.
