**Valuation Date: 1/1/2024**

**Actuarial Assumptions and Methods** (continued)

**Turnover Rates:** Given its size, the Plan’s experience is not credible. No termination rates have been assumed in the valuation. The actuary has determined that turnover rates are not material to the determination of the Plan’s liability.

**Retirement Rates:** Given its size, the Plan’s experience is not credible. The actuary believes that the best expectation of future experience is 100% retirement at Normal Retirement Age but not before January 1, 2025. Terminated vested participants are assumed to commence immediately. Gains or losses resulting from actual retirement experience will be recognized through the routine application of the actuarial cost method.

**Form of Payment:** It has been assumed that benefits will be paid in a lump sum. To the extent optional forms of payment are elected and conversions are determined under an actuarial basis, which differs from the basis funded in the valuation, gains or losses will occur. These gains or losses will be recognized through the routine application of the actuarial cost method.

**Marital Status:** Marital Status is not applicable in the valuation due to the death benefit being 100% of the vested accrued benefit and the assumed form of payment being a lump sum.

**Actuarial Value of Plan Assets for Funding Purposes:** The actuarial value of assets is equal to the market value of assets (including discounted employer contributions receivable) on the valuation date.

**Actuarial Assumptions and Methods** (continued)

**Actuarial Cost Method:** The unit credit cost method is used for ERISA Funding Target (FT) purposes. Under this method, accrued pension benefits are determined for all eligible active participants. These benefits reflect service, salary and negotiated benefit increases to date. The liability is then equal to the present value of all benefits for inactive participants plus the PVAB for active participants.

The normal cost is determined on an individual basis for all active participants who have not attained the assumed retirement age and is equal to the present value of the difference between the current accrued benefit and the anticipated accrued benefit one year later, with the accrued benefit based upon earnings, or negotiated benefit increases, to date in both cases. The total normal cost is based upon the sum of the individual normal costs. The target normal cost for funding is equal to the total normal cost plus assumed administrative expenses expected to be paid from the trust.

The projected unit credit method is used for IRS maximum deductible limit cushion amount. Under this method, accrued pension benefits are determined for all eligible active participants reflecting service to date and anticipated salary and negotiated benefit increases to the assumed retirement age. This liability for active participants is then added to the present value of all benefits for inactive participants to determine the total liability under this method.

The normal cost is determined on an individual basis for all active participants who have not attained the assumed retirement age and is equal to the present value of the difference between the current accrued benefit and the anticipated accrued benefit one year later, with the accrued benefit based upon earnings and negotiated benefit increases projected to assumed retirement age in both cases. The total normal cost is based upon the sum of the individual normal costs.
