Actuarial Assumptions and Methods

ERISA Interest Rates as required by IRC Section 430 based on plan sponsor election of the look-back month for the segment rates:

“Minimum” means for the purpose of calculating the PPA funding liability and normal cost for the minimum required contribution.

“Maximum” means for the purpose of calculating the PPA funding liability and normal cost for the maximum tax-deductible contribution.

Purpose	2024 Plan Year		2023 Plan Year	
	Minimum	Maximum	Minimum	Maximum
Segment rates or full yield curve	Segment	Segment	Segment	Segment
Look-back months	4	4	4	4
First 5 years	4.75%	3.62%	4.75%	1.41%
Next 15 years	4.87%	4.46%	5.00%	3.09%
Over 20 years	5.59%	4.52%	5.74%	3.58%
Applicable Law for the segment rates corridor	ARPA	Not Applicable	ARPA	Not Applicable

Expected Long-Term Return on Plan Assets: 4.50% (previously 4.00%), based on historical returns of indices, ultimately decided by the company.

Salary Scale: 3.00% (unchanged). This is a long-term assumption based on the Taxable Wage Base (TWB) assumption, adjusted downward by 0.75% to reflect expected pay increases for the company.

Expected Return on Retirement Account: 6.25% per year. This is a long-term assumption based on the returns that individual participants earn in their offsetting retirement account investments and is based on long term asset return expectations for plan participants' individual accounts.

Increase in Consumer Price Index (CPI): 3.25%. This is based on long-term historical inflation rates of about 3.80%, adjusted lower by 0.55% to reflect the current low interest rate environment.

Actuarial Assumptions and Methods (continued)

Increase in Social Security Taxable Wage Base: 3.75%. This is based on the CPI assumption, increased 0.50% based on the historical difference between the CPI and TWB of 0.50% - 1.00%.

Administrative Expenses included in the Target Normal Cost: \$0. As of the valuation date, expenses are not paid from the trust assets. This is assumed to continue.

Mortality:

ERISA: IRS 2024 Generational Mortality Table as prescribed by IRC Section 430 (previously IRS 2023 Static Mortality Table using separate tables for annuitants and non-annuitants). This is a fully generational mortality table based on the Pri-2012 Total Mortality Tables projected with the adjusted MP 2021 Mortality Improvement Scale with annual mortality improvements capped at 0.78% as required by Secure 2.0 Act. This plan does not have a large enough population to vary from the standard tables.

Separations from Service: Rates varying by age. These rates are based on the assumption used by a prior actuary for this plan in 2012. There has been no pattern of significant consistent gains or consistent losses related to this decrement.

Representative values of the assumed annual rates of withdrawal and retirement are as follows:

Annual Rates of Withdrawal			
Age	Male	Female	Early and Normal Retirement
21	11.50%	19.40%	
25	9.30	13.91	
30	6.50	9.30	
35	4.50	6.50	
40	2.60	4.50	
45	1.40	2.60	
50	0.20	1.40	
55	0.00	0.20	8.00%
57			8.00
60			20.00
61			20.00
62			20.00
63			20.00
64			20.00
65			100.00

Actuarial Assumptions and Methods (continued)

Marital Status: 100% of males and females are assumed married, with females 3 years younger than males. This is based on the prior assumption used by the prior actuary for this plan and checked for reasonability each year.

Maximum Benefit: \$275,000 for 2024.

Maximum Salary: \$345,000 for 2024.

Actuarial Value of Plan Assets for Funding Purposes:

The actuarial value of assets is equal to:

- a) the market value of assets, including discounted receivables, on the valuation date, less
- b) the following percentages of prior years' investment gains (losses):
 - i) 67% of the prior year, and
 - ii) 33% of the second prior year,

Investment gains and losses are defined as the excess or deficiency of the expected return on the market value (not to exceed the third segment rate for that year) over the actual return on the market value of assets, including discounted receivables, for any given year.

- c) The actuarial value of assets can be neither less than 90% nor greater than 110% of the market value of assets, including discounted receivables.

Shortfall Amortization Charge for ERISA Funding Purposes: Per IRC Section 430(c), the shortfall amortization charge for any plan year is the aggregate total (not less than zero) of the shortfall amortization installments for such plan year with respect to any shortfall amortization base which has not been fully amortized. The shortfall amortization installments are the amounts necessary to amortize the shortfall amortization base of the plan for any plan year in level annual installments over the 15-year period beginning with such plan year.

Actuarial Assumptions and Methods (continued)

Actuarial Cost Method: The unit credit cost method is used for ERISA funding target (FT). Under this method, accrued pension benefits are determined for all eligible active participants. These benefits reflect service, salary and negotiated benefit increases to date. The liability is then equal to the present value of all benefits (PVAB) for inactive participants plus the PVAB for active participants.

The normal cost is determined on an individual basis for all active participants who have not attained the assumed retirement age and is equal to the present value of the difference between the current accrued benefit and the anticipated accrued benefit one year later, with the accrued benefit based upon earnings, or negotiated benefit increases, to date in both cases. The total normal cost is based upon the sum of the individual normal costs. The target normal cost for funding is equal to the total normal cost plus assumed administrative expenses expected to be paid from the trust.

The projected unit credit method is used for IRS maximum deductible limit cushion amount. Under this method, accrued pension benefits are determined for all eligible active participants. These benefits reflect service to date and anticipated salary and negotiated benefit increases to the assumed retirement age. The liability is then equal to the present value of all benefits for inactive participants plus the PVAB for active participants.

The normal cost is determined on an individual basis for all active participants who have not attained the assumed retirement age and is equal to the present value of the difference between the current accrued benefit and the anticipated accrued benefit one year later, with the accrued benefit based upon earnings and negotiated benefit increases projected to assumed retirement age in both cases. The total normal cost is based upon the sum of the individual normal costs.
