Pre-retirement survivor annuity

Age and service requirements: 5 years of service, regardless of age

Amount: An immediately payable benefit, equal to 75% of the benefit that the participant would have received had the participant retired the day before death with a 75% Joint and Survivor Annuity. However, if the participant did not survive to age 55, the reduction for early retirement will not exceed 36%.

Appendix A: Summary of Plan Provisions

Normal form of payments

All retirements are paid in the form of a 75% joint and survivor annuity unless this form is rejected by the participant and spouse. The benefit amount payable is reduced (95% for same age participant/spouse on non-disability pension) to reflect the joint and survivor coverage. In the event that the spouse predeceases the participant, the monthly pension amount will revert back to the original amount. If this type of pension is rejected, benefits are payable for the life of the participant without reduction (minimum guarantee of 60 monthly payments) or in any other available optional form elected by the participant in an actuarially equivalent amount.

Optional forms of benefits

75% Joint and Survivor Annuity ("QJSA")

Life Annuity with 5-Year Certain Form of Benefit

Appendix B: Summary of Actuarial Assumptions and Methods

Certain assumptions are prescribed as noted below. The other assumptions are estimates derived from historical and recent experience as well as market observations, combined with professional judgment about future expectations.

Interest

The interest rates used for the 2024 plan year are the 24-month average corporate bond segment rates for April 2024 as published in May (a 4-month lookback) subject to funding stabilization. Under stabilization, the interest rates used for funding purposes are calculated in the usual manner (24-month average corporate bond rates) but are then constrained to be within a corridor around a 25-year average of those same bond rates. Each of the three segments of the yield curve reflecting the 25-year average rates is constrained to be no less than 5%. For 2024, the stabilization corridor is 5%. It will remain at 5% through 2030 and then increase by 5% per year beginning in 2031 until it reaches 30% for 2035. The interest rate description above reflects that the plan sponsor elected to apply the ARPA provisions beginning with the 2021 Plan year. The rates are as follows:

Year	Payments in the First 5 Years	Payments in Years 6–20	Payments Thereafter	Effective Interest Rate
Current Year , reflecting stabilization	4.84%	5.24%	5.59%	5.34%
Current Year , without stabilization	4.84%	5.24%	5.22%	5.20%
Prior Year , reflecting stabilization	4.75%	5.00%	5.74%	5.26%
Prior Year , without stabilization	2.85%	4.02%	4.19%	4.02%

The Standard “spot segment rates” are currently used to determine the PBGC variable-rate premium. The applicable spot segment rates are rates, as published by the IRS, for the month preceding the month in which the plan year begins. For the Plan Year beginning September 1, 2024, the applicable August 2024 rates are 4.50% for the first 5 years, 4.96% for the next 15 years and 5.40% after.

Appendix B: Summary of Actuarial Assumptions and Methods

Mortality rates

Pri-2012 combined employee and annuitant healthy mortality tables projected through the valuation date plus a number of years that varies by age and sex per IRC 1.430(h)(3)-1(c)(3)(ii)(A) using the Adjusted MP-2021 scale as described in the final IRS mortality regulations released in October 2023. This assumption is one of the choices allowed by the regulations. The prior year assumption used RP-2006 separate employee and annuitant healthy mortality tables, projected through the valuation date plus a number of years that varies by age and sex per IRC 1.430(h)(3)-1(c)(3)(ii)(A) using scale MP-2021.

This assumption is one of the choices allowed by the regulations. This reflects an update to the mandated mortality projection assumption.

Salary increases

The Actuary's Pension Handbook S-7 Scale, plus 2% per year allowance for inflation. The table below shows the assumed increases for various sample ages.

Benefit election

85% of the participants are assumed to elect the 75% Joint and Survivor option at retirement and the remaining 15% are assumed to elect the Life Annuity (minimum guarantee of 60 monthly payments) option.

This assumption is based on historical and current data, adjusted to reflect estimated future experience and professional judgment.

Appendix B: Summary of Actuarial Assumptions and Methods

Description of weighted average retirement age

Age 60.8, determined as follows: The individual weighted-average retirement age for each participant is calculated as the sum of the product of each current or future retirement age times the probability of surviving from current age to that age and then retiring at that age, assuming no other decrements. The overall weighted-average retirement age is the average of the individual weighted-average retirement ages based on all the active participants included in this actuarial valuation.

Retirement from inactive status

Age 55

Unknown data for participants

Same as those exhibited by participants with similar known characteristics. If not specified, participants are assumed to be male.

Definition of active participants

Employed by Administrative Office on valuation date

Percent married

85%. Spouse is assumed to be the opposite gender.

Age difference

Male spouses are assumed to be four years older than female spouses.

Administrative expenses

Paid outside plan assets.

Appendix B: Summary of Actuarial Assumptions and Methods

Asset method

As selected by the plan sponsor, assets are determined by averaging the market value as of the valuation date and the adjusted market values as of the preceding two years. The resulting value is limited to between 90% to 110% of market value of assets. The adjusted market values reflect cash flow and expected earnings to the valuation date. The expected earnings are based on an assumed rate of return of 7.50%, not to exceed the applicable third segment rate 5.92% for 2022–2023 and 5.74% for 2023–2024.

Funding method and contribution requirement

Funding method is unit credit actuarial cost method, as prescribed by law. The liability is measured on an accrual-to-date basis using mandated mortality tables and interest rates with no salary projection past the end of the year.

Plan sponsors are required under Internal Revenue Code Section 430 to make a minimum level of contributions to qualified pension plans. Available credit balances can be used to satisfy this required contribution. In general, the minimum required contribution is the sum of the target normal cost and an installment that amortizes the plan's funding shortfall, offset by any plan overfunding, if applicable. If all assumptions are met (including the investment earnings implicitly assumed by the interest rate), funding the plan at the minimum required contribution level is generally designed to achieve a 100% funded status within fifteen years. Once that is achieved, or for overfunded plans, the minimum required contribution will generally equal the target normal cost reduced by any overfunding.

FASB ASC 960 assumptions

Interest: 7.50%

The net investment return assumption is a long-term estimate derived from historical data, current and recent market expectations, and professional judgment. As part of the analysis, a building block approach was used that reflects inflation expectations and anticipated risk premiums for each of the portfolio's asset classes as provided by Segal Marco Advisors, as well as the Plan's target asset allocation.

Mortality: Same as for statutory funding

The Pri-2012 mortality tables, projected to 2024 using the adjusted MP-2021 scale, as described in the final IRS mortality regulations released in October 2023, reasonably reflect the projected mortality experience of the Plan as of the measurement date. The additional projection past the measurement date is a provision made for future mortality improvement.

Appendix B: Summary of Actuarial Assumptions and Methods

Actuarial models

Segal valuation results are based on proprietary actuarial modeling software. The actuarial valuation models generate a comprehensive set of liability and cost calculations that are prepared to meet regulatory, legislative and client requirements. Our Actuarial Technology and Systems unit, comprising both actuaries and programmers, is responsible for the initial development and maintenance of these models. The models have a modular structure that allows for a high degree of accuracy, flexibility and user control. The client team programs the assumptions and the plan provisions, validates the models, and reviews test lives and results, under the supervision of the responsible Enrolled Actuary.

The results for determining the Scheduled Cost are also based on models developed by Segal actuaries and programmers. The client team customizes and validates the models, and reviews the results, under the supervision of the responsible Enrolled Actuary.

Section 2: Valuation Results — Funding

Shortfall amortization bases

The unfunded funding target (funding target minus actuarial value of assets net of credit balances) is amortized over fifteen years. In each year, the unfunded funding target minus the outstanding balance of the prior shortfall bases established is set up as another base and amortized over a new fifteen-year period. If the unfunded funding target falls below zero (i.e., net assets exceed the funding target), all existing bases are eliminated. Further, the Plan is exempt from establishing a shortfall amortization base if the funded percentage (with assets net of the prefunding balance, if any portion of the prefunding balance is used to offset the required contribution during the current year) is at least 100%.

Schedule of Shortfall Amortization Bases as of September 1, 2024

Year Established	Original Base	Present Value of Remaining Installments	Years Remaining	Shortfall Amortization Installment
2024	\$252,303	\$252,303	15	\$23,402
